
POLLUTION PREVENTION

Clint Guymon, PhD PE

Brigham Young University

1st Jan, 2025

created in  Curvenote

Keywords Spiritual Safety, Process Safety, Chemical Engineering, Risk Assessment

Learning Outcomes

- Download and analyze air quality data from EPA monitoring stations.
- Discuss the Pollution Prevention Act (1990) and its hierarchy of strategies, prioritizing source reduction.
- Define concepts of sustainability and life-cycle analysis (cradle-to-grave) in chemical production.

Reading

- Foundations of Spiritual and Physical Safety: with Chemical Processes; Section X11.4

1 Air Quality

1.1 National Ambient Air Quality Standards (NAAQS)

1.2 Air Quality Map

1.3 Air Data

Link: <https://epa.maps.arcgis.com/apps/webappviewer/index.html?id=5f239fd3e72f424f98ef3d5def547eb5&extent=-146.2334,13.1913,-46.3896,56.5319>

Click the layers and choose CO and navigate to your location.

HW:

- If I worked outside and otherwise spent the whole day exposed to the air in the city of Provo, what would have been my TWA exposure to CO on 1/1/2020?
- How does that value compare to the NAAQS for CO? How does it compare to the PEL for CO?
- Plot the CO levels near Provo for the months of January-May 2020. Add the PEL and NAAQS levels for CO to the plot.

Criteria Air Pollutants

[Criteria Air Pollutants Home](#)

Information by Pollutant

- [NAAQS Review Process](#)
- [NAAQS Designations Process](#)
- [NAAQS Implementation Process](#)
- Current NAAQS Table**

NAAQS Table

The [Clean Air Act](#), which was last amended in 1990, requires EPA to set National Ambient Air Quality Standards (40 CFR part 50) for six principal pollutants (["criteria" air pollutants](#)) which can be harmful to public health and the environment. The Clean Air Act identifies two types of national ambient air quality standards. **Primary standards** provide public health protection, including protecting the health of "sensitive" populations such as asthmatics, children, and the elderly. **Secondary standards** provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

Periodically, the standards are reviewed and sometimes may be revised, establishing new standards. The most recently established standards are listed below. In some areas of the U.S., certain regulatory requirements may also remain for [implementation of previously established standards](#).

Units of measure for the standards are parts per million (ppm) by volume, parts per billion (ppb) by volume, and micrograms per cubic meter of air ($\mu\text{g}/\text{m}^3$).

Pollutant [links to historical tables of NAAQS reviews]	Primary/ Secondary	Averaging Time	Level	Form
Carbon Monoxide (CO)	primary	8 hours	9 ppm	Not to be exceeded more than once per year
		1 hour	35 ppm	
Lead (Pb)	primary and secondary	Rolling 3 month average	0.15 $\mu\text{g}/\text{m}^3$ [1]	Not to be exceeded

Interactive Map of Air Quality Monitors

The AirData Air Quality Monitors app is a mapping application available on the web and on mobile devices that displays monitor locations and monitor-specific information. It also allows the querying and downloading of data daily and annual summary data.

Map layers include:

- Monitors for all criteria pollutants (CO, Pb, NO₂, Ozone, PM₁₀, PM_{2.5}, and SO₂)
- PM_{2.5} Chemical Speciation Network monitors
- IMPROVE (Interagency Monitoring of PROtected Visual Environments) monitors
- NATTS (National Air Toxics Trends Stations)

Figure 2: Image of the EPA's website where you can find maps of air quality monitors. Link: <https://www.epa.gov/outdoor-air-quality-data/interactive-map-air-quality-monitors>

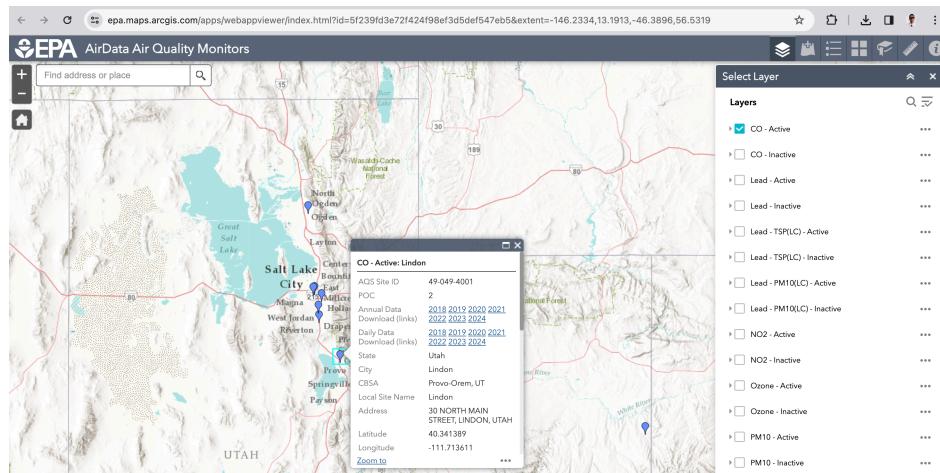

Figure 3: Image of the EPA's Air Data website where you can download air quality data for different locations with Utah shown.

1.4 National Emission Standards for Hazardous Air Pollutants (NESHAP)

188 NESHAP standards have been established for 174 source categories. These standards limit the amount of hazardous air pollutants that may be emitted from a source. Chemicals such as benzene, mercury compounds, selenium compounds, asbestos, vinyl chloride, and many others are regulated by NESHAP standards.

2 Pollution Prevention Act (PPA), 1990

Focuses on pollution prevention (P2) as the nation's primary pollution strategy. Hierarchy:

- Source reduction
- In-process recycling
- On-site recycling
- Off-site recycling
- Treatment
- Disposal
- Release

Requires P2 efforts for TRI (Toxic Release Inventory) permits. TRI permits are required for facilities that manufacture, process, or use more than a threshold amount of a listed toxic chemical. The PPA also requires the EPA to establish a P2 information clearinghouse.

- In-process recycling is the reuse of materials within a process.
- On-site recycling is the reuse of materials within a facility.
- Off-site recycling is the reuse of materials outside a facility.
- Treatment is the use of physical, chemical, or biological processes to reduce the toxicity or volume of waste.
- Disposal is the final disposition of waste.
- Release is the discharge of waste into the environment.

3 Source Reduction

Source reduction is the reduction or elimination of waste at the source. The intent is to reduce:

- energy use
- raw material use
- waste minimization
- environmental releases
- used solvents
- waste water
- air emissions

Reducing the amount of waste generated in a significant increase in the efficiency of the process. For example, if a process generates 1000 pounds of waste and 100 pounds of product, the process efficiency is 10% ($100/1100$). If the process is modified to generate 10 pounds of waste and 100 pounds of product, the process efficiency is 91% ($100/110$).

Case Scenario - production of nitric acid:

- The production of nitric acid generates a large amount of NOx emissions.
- The process can be modified to reduce the amount of NOx emissions.

Some additional specific examples of source reduction include:

- LED lighting
- Higher efficiency furnaces
- Higher efficiency air conditioners

HW: Research a source reduction scenario and provide a brief summary.

3.1 Waste Minimization

- Substitution of less hazardous materials
- Process modification
- Inventory control
- Equipment optimization
 - Fugitive emissions (Gold capture air particulate in gold processing)

4 Sustainability

Sustainability means meeting the needs of today without compromising the ability of future generations to meet their needs

5 Life-Cycle Analysis

1. Scope
 - Establish system boundaries
 - Determine functional unit (including life expectancy)
2. Inventory
 - Inputs: raw materials, energy
 - Outputs: products, byproducts, wastes, emissions
3. Impact assessment
 - Environmental impacts of all steps in life cycle
4. Improvement analysis
 - Generate alternatives
 - Consider each step
5. Cradle-to-grave analysis
 - Consider all steps in life cycle
 - Consider end use
 - Consider disposal

6 Superfund Amendments and Reauthorization Act (SARA)

A superfund site is any land in the United States that has been contaminated by hazardous waste and identified by the EPA as a candidate for cleanup because it poses a risk to human health and/or the environment. The Superfund program was established by the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) in 1980. The Superfund Amendments and Reauthorization Act (SARA) was passed in 1986 to amend CERCLA. SARA expanded the Superfund program and added new provisions to the law. SARA also established the Emergency Planning and Community Right-to-Know Act (EPCRA).

Some prominent superfund sites include:

- Love Canal, New York
- Times Beach, Missouri
- Rocky Flats, Colorado

6.1 Love Canal

The Love Canal site is located in Niagara Falls, New York. The site was originally a canal that was dug in the late 19th century to provide hydroelectric power to the city. The canal was abandoned and used as a chemical waste dump in the 1940s and 1950s. In the 1970s, residents of the Love Canal neighborhood began to report health problems, including birth defects, miscarriages, and cancer. Investigations revealed that the site was contaminated with over 20,000 tons of hazardous waste, including dioxin, benzene, and other chemicals. The Love Canal site was declared a federal emergency in 1978, and the residents were evacuated. The site was later cleaned up and capped, and is now a public park.

HW: Research a superfund site and provide a brief summary.

Figure 4: Image of the restored Love Canal site, now a public park.

7 Bioaccumulation

Bioaccumulation is the accumulation of substances, such as pesticides, or other chemicals in an organism. Bioaccumulation occurs when an organism absorbs a substance at a rate faster than that at which the substance is lost. This can occur through inhalation, ingestion, or direct contact. The substance can accumulate in the organism's tissues, and can be passed on to the next trophic level in a food chain. Bioaccumulation can have harmful effects on organisms, and can lead to biomagnification, which is the increase in concentration of a substance as it moves up the food chain.

8 Solubility

Solubility is the ability of a substance to dissolve in a solvent. The solubility of a substance is dependent on the temperature and pressure of the solvent. The solubility of a substance can be expressed as the amount of solute that can be dissolved in a given amount of solvent. The solubility of a substance can be determined experimentally, and can be used to predict the behavior of the substance in a given solvent.

What happens if the solubility of a substance is exceeded? The substance will precipitate out of solution into a 3rd phase. This can be a solid, liquid, or gas depending on the substance and the solvent.

Action Items

1. Download air quality data for your hometown (or from a monitoring station next to your city) from the EPA's AirData website and determine your TWA exposure to CO on a specific date.
2. Generate a similar plot to Figure XII.9([Guymon, 2025](#)) for your city (or from a monitoring station next to your city) showing a box plot for at least 2 years for PM2.5. Is the air quality better in the most recent years? Is that difference statistically significant?
